

Task 1: • Create a button in a React component that, when clicked, changes the text from "Not Clicked" to "Clicked!" using event handling.

App.js

```
import React, { useState } from 'react';
```

```
function ClickButton() {
```

```
  // Initialize state to track whether the button has been clicked
```

```
  const [text, setText] = useState('Not Clicked');
```

```
  // Event handler to change the text
```

```
  const handleClick = () => {
```

```
    setText('Clicked!');
```

```
  };
```

```
  return (
```

```
    <div>
```

```
      <p>{text}</p> {/* Display the current text */}
```

```
      <button onClick={handleClick}>Click Me</button> {/* Button that triggers the handleClick function */}
```

```
    </div>
```

```
  );
```

```
}
```

```
export default ClickButton;
```

Not Clicked

Click Me

Clicked!

Click Me
